Productivity Pack

ProNest LT optional module

Productivity modules

Benefits

- Improve material utilization and reduce cut length with Common Line Cutting
- Reduce pierces and up/down torch motion for faster cutting, while maximizing consumable life with Chain and Bridge Cutting
- Speed unloading and achieve safer, easier-to-remove pieces with Skeleton Cut-up

About

The Productivity Pack combines Common Line Cutting (CLC), Chain and Bridge Cutting, and Skeleton Cut-up in one convenient module. Together, these tools help you get more value from every sheet and production cycle by reducing scrap, minimizing unnecessary pierces, and simplifying downstream skeleton handling.

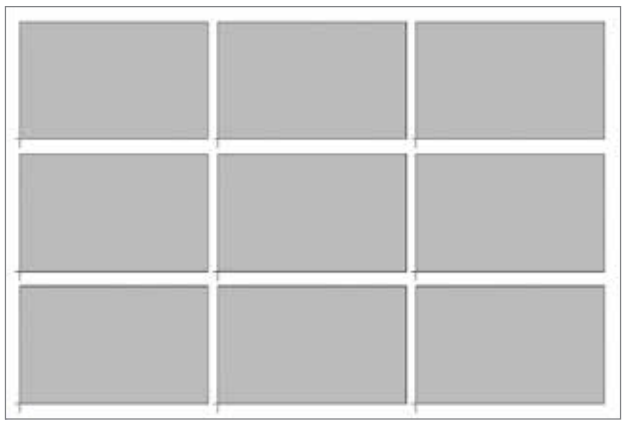

How it works

Common Line Cutting

With CLC, you can share common edges between adjacent parts to reduce cut length, consumable wear, and material waste. Apply it manually to create pairs or quads, or automatically to add similar parts from the part list. Kerf compensation is applied automatically and can be set as crossing or non-crossing based on the cut process. Safety cuts help avoid tip-up situations, while support for dissimilar part profiles, plate-edge nesting, and customizable tool paths help increase material utilization and control.

Before Common Line Cutting

Parts nested: 9
True utilization: 75%

After Common Line Cutting

Parts nested: **14**
True utilization: **90%**

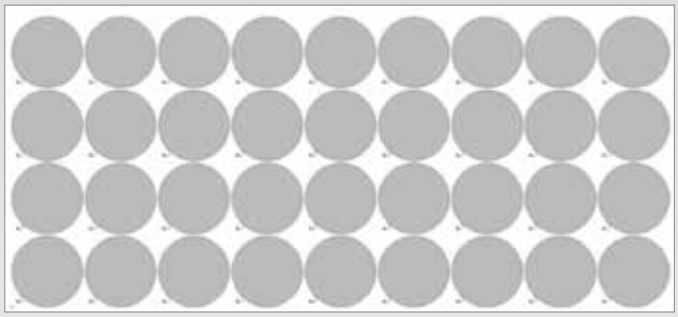

Eliminate gaps between parts to reduce cutting distance and material waste. Fewer pierces increase productivity and extend consumable life.

Chain Cutting

Chain Cutting links multiple part profiles into one continuous cut, either manually after nesting or automatically as a part array. It cuts multiple parts from a single pierce, increasing consumable life, and avoiding repeated pre-heat cycles for oxyfuel.

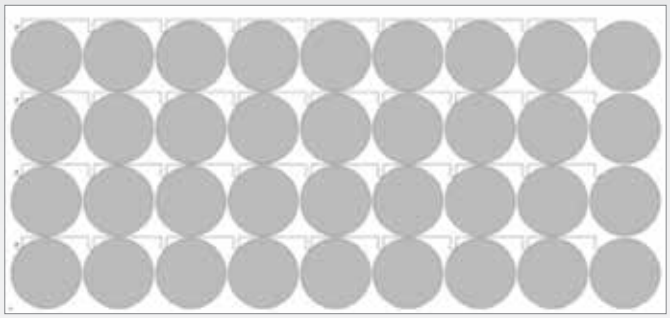

Before Chain Cutting

Number of pierces: 36

After Chain Cutting

Number of pierces: 4

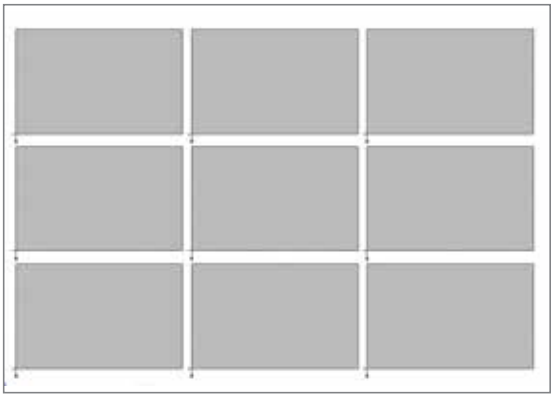

Bridge Cutting

Similar to Chain Cutting, Bridge Cutting links parts into a continuous cut, but also leaves a thin web of material to hold small parts in place during separation.

Adjust bridge width and connection radius to control how parts stay connected. Set bridge width to zero to connect parts with one pierce and no bridge material.

Before Bridge Cutting

Number of pierces: 9

After Bridge Cutting

Number of pierces: 1

Additional features included:

- Bridge dynamic align

Skeleton Cut-up

Manually cutting skeletons with a hand torch can take 3x longer than using the cutting table. The Skeleton Cut-up feature automatically cuts leftover skeleton material into manageable sections for faster, safer unloading.

Before and after

Before Skeleton Cut-up

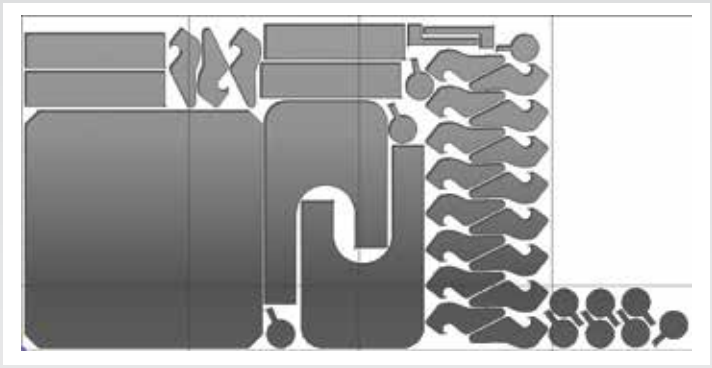

Estimated time to complete manually:

45 minutes

After Skeleton Cut-up

Estimated time to complete automatically:

15 minutes

Operators can save between 15–30 minutes per sheet in unloading time.

For an annual production of 4,000 sheets, the labor savings alone is significant (25–50 man-weeks per year).

Consider the Advanced Productivity module to further improve your operation. Additional features include:

Common Line Cutting

- Edit torch paths
- CLC dissimilar parts
- Safety cuts
- CLC with plate edge
- CLC dynamic align
- CLC while auto nesting

Chain and Bridge Cutting

- Bridge dynamic align

Skeleton Cut-up

- Cut Sequence – integrate skeleton lines with parts
- Settings XLS
